(57) Abstract :

The AI-powered cross-domain disease detection system collects data from wearable devices (101), including heart rate, sleep quality, activity levels, and mood patterns, along with patient input (102) capturing self-reported symptoms and emotional states. The collected data is securely processed in a backend storage and processing unit (103) and analyzed using AI/machine learning models (104) to detect patterns, abnormalities, and potential cross-domain health risks. Results are visualized on an interactive dashboard (105) through weekly charts of mood fluctuations, heart rate trends, sleep quality, and emotion distributions. The system further provides a doctor consultancy module (106), enabling continuous communication and personalized medical advice. By combining wearable analytics, emotional assessment, AI-driven predictions, and expert consultation, the invention offers a preventive, holistic, and accessible solution for improving patient well-being and early disease detection.
